

Week 37 exercises – INF201 2026

Task 1 – Write pretty code

The script `week37_task01_broken.py` is truly hideous. Re-write this script so that it follows the PEP8 guidelines and has useful comments. Optionally: Include type hints where appropriate in your script.

Task 2 – Not as intended

The script `week37_task02_broken.py` was supposed to go through a list of scores for students in a class and calculate the average score for the students who passed the class. However, it is not working as intended. Re-write the script so that it does this correctly, while also following the guidelines stated in task 1.

Task 3 – Helping out a friend

A friend of yours is fed up with their many failed attempts at dating and is convinced the problem is zodiac sign incompatibility. They want to create a dating app which checks whether two potential matches have compatible zodiac signs. As the non-judgmental friend you are, you agree to help them by providing some Python code that could be used for this purpose. As starting point, the two of you have collected information about each zodiac sign and their compatibilities in the file `zodiac_signs.csv`

Your task is to come up with Python code you think will be relevant here. The code should *at least* be able to identify a person's zodiac sign and in some way check compatibility based on the information provided in the csv file.
