

Week 41 extra exercises – INF201 2026

Task 1 – Flatted a nested list

Write a function that flattens a nested list of any depth. You may assume that the list is reasonably small (no more than 100 elements) and no more than 10 levels deep. The input list can contain elements of type int, float, str, bool, None, list and/or tuple, so your function should work for any of these.

Some examples of expected output:

- If you run your function on the list `[1, 2, [3, 4]]` it should return `[1, 2, 3, 4]`
- If you run your function on the list `["this", ["is", ["a", "list"]]]` it should return `["this", "is", "a", "list"]`
- If you run the function on an empty list, it should return an empty list

Task 2 – Process error logs

You work in an international company and have been given four error log files saved in different text encodings. Write a Python function (or set of functions) that reads these files, extract the lines starting with “[“, and collect these lines from all the files into one txt-file. This file should have UTF-8 encoding with BOM. Please include the generated txt-file in your submission.

Hand-in information

- Remember to include filename extension for all submitted files
- You may submit Python scripts (.py) or Jupyter notebooks (.ipynb), no zip-folders please
- If you submit a Jupyter notebook, please upload a pdf version as well
- AI chat-log can be submitted in its entirety or summarized (see lecture_02)
